## EchoMind Enterprise — The Private AI Platform

---

EchoMind Enterprise is a private, on-premises AI platform designed for organizations that require the highest level of data security and control. By running on a customer's own NVIDIA GPU hardware, the platform provides a secure and reliable environment for modern AI capabilities.

- Chat and conversation intelligence
- Live meeting intelligence
- Voice and speech recognition
- Document generation and content creation

## 2

# The Problem: AI You Cannot Send to the Cloud

---

Cloud AI assistants pose a significant risk to organizations that handle sensitive data. These assistants quietly send prompts, files, and recordings to outside vendors, which can compromise confidentiality and compliance. For instance, a cloud AI assistant may transmit sensitive information, such as meeting notes or customer data, to a third-party server without the organization's knowledge or consent.

- Sensitive data is transmitted to outside vendors
- Compliance and confidentiality are compromised
- Organizations risk data breaches and reputational damage

EchoMind Enterprise solves this problem by providing a private, on-premises AI platform that runs entirely on the customer's own NVIDIA GPU hardware. This means that all AI processing occurs locally, without the need for internet connectivity or third-party AI APIs.

Comparison of Cloud AI Assistants and EchoMind Enterprise

| Cloud AI Assistants                                    | EchoMind Enterprise                                |
|--------------------------------------------------------|----------------------------------------------------|
| Send prompts, files, and recordings to outside vendors | Run entirely on customer's own NVIDIA GPU hardware |
| Risk data breaches and reputational damage             | Maintain confidentiality and compliance            |
| Compromise compliance and confidentiality              | Ensure data sovereignty and control                |

## What EchoMind Enterprise Is

EchoMind Enterprise is a comprehensive private AI platform that offers five distinct modules to cater to various organizational needs. Each module is designed to provide a seamless and secure experience, ensuring that sensitive data remains within the organization's premises.

- Knowledge Chat
- Live Transcription
- Boardroom
- Voice Conversation
- Document Studio

These modules are the core components of the EchoMind Enterprise platform, and each one is designed to address specific use cases and requirements.

EchoMind Enterprise Modules

| Module             | Description                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------|
| Knowledge Chat     | A conversational AI that provides real-time information and insights to users               |
| Live Transcription | A module that enables real-time transcription of audio and video content                    |
| BoardRoom          | A module designed for meeting intelligence, providing insights and summaries of discussions |
| Voice Conversation | A module that enables secure and private voice conversations                                |
| Document Studio    | A module for document generation, allowing users to create high-quality documents with ease |

Each module is carefully designed to ensure that sensitive data remains within the organization's control, eliminating the risk of data breaches or unauthorized access.

## The Five Modules

EchoMind Enterprise is comprised of five distinct modules, each designed to address a specific need in the organization's AI strategy. These modules work together seamlessly to provide a comprehensive AI solution.

- Chat
- Live Meeting Intelligence
- Voice
- Document Generation
- Model Management

Here's a closer look at each of the five modules and their features:

| Module                    | Description                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Chat                      | Enables organizations to build custom chatbots that can interact with customers, employees, or other stakeholders.                         |
| Live Meeting Intelligence | Provides real-time insights and analytics on meeting discussions, allowing for more informed decision-making.                              |
| Voice                     | Empowers organizations to create custom voice assistants that can interact with customers, employees, or other stakeholders.               |
| Document Generation       | Automates the creation of documents, reports, and other written content, reducing manual workload and increasing productivity.             |
| Model Management          | Allows organizations to manage and govern their AI models, ensuring compliance with regulatory requirements and maintaining data security. |

Each module is designed to be highly customizable, allowing organizations to tailor the solution to their specific needs and goals.

## EchoMind Edge Devices

EchoMind edge devices are designed to connect to the organization's knowledge base while remaining fully offline. This is made possible by the platform's ability to run on-premises, using the customer's own NVIDIA GPU hardware. The edge devices can be deployed in the field, allowing for real-time processing and analysis of data without the need for an internet connection.

- The edge devices can be deployed in various locations, such as data centers, remote offices, or even on-site with customers.

EchoMind Edge Devices

| Edge Device Type     | Description                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------|
| Standard Edge Device | A standard edge device that connects to the host's knowledge base and runs AI models locally.                       |
| Advanced Edge Device | An advanced edge device that includes additional features such as real-time data processing and advanced analytics. |

## Secure Offline-to-Online Content Export

In the EchoMind Enterprise platform, the secure process of exporting content from the offline world to the online layer is designed to mitigate the risks associated with data transfer. This is achieved through a carefully controlled and audited process that ensures the integrity and confidentiality of sensitive information.

1. The offline-to-online content export process involves several key steps:
2. 1. Content is first extracted from the offline environment and stored in a secure, isolated area.
3. 2. The extracted content is then reviewed and validated to ensure that it meets the required security and compliance standards.
4. 3. Once validated, the content is encrypted and packaged for transfer to the online environment.
5. 4. The encrypted content is then transmitted to the online layer using secure, end-to-end encryption protocols.
6. 5. The online environment verifies the authenticity and integrity of the content before making it available for use.

Secure Offline-to-Online Content Export Process

| Step                  | Description                                     | Risk Mitigation                                    |
|-----------------------|-------------------------------------------------|----------------------------------------------------|
| 1. Content extraction | Extracting content from the offline environment | Data loss or corruption due to improper extraction |

| Step                   | Description                                                             | Risk Mitigation                                                 |
|------------------------|-------------------------------------------------------------------------|-----------------------------------------------------------------|
| 2. Content validation  | Validating content to ensure it meets security and compliance standards | Invalid or incomplete content due to inadequate validation      |
| 3. Content encryption  | Encrypting content for secure transfer                                  | Data breaches or unauthorized access due to weak encryption     |
| 4. Secure transmission | Transmitting content using end-to-end encryption protocols              | Data interception or eavesdropping due to insecure transmission |
| 5. Online verification | Verifying content authenticity and integrity                            | Data tampering or corruption due to inadequate verification     |

## Offline and Online Layers

EchoMind Enterprise's architecture is designed with two distinct layers: an offline layer and an online layer. This separation of concerns enables customers to maintain the highest level of security and control over their sensitive work.

- The offline layer consists of the AI models and the NVIDIA GPU hardware, which run locally on the customer's premises.

- This layer is responsible for processing and generating insights, without any internet dependency at runtime.
- The online layer, on the other hand, is a web-based interface that allows customers to configure, monitor, and manage the AI platform.

Key differences between the offline and online layers of EchoMind Enterprise

| Offline Layer                     | Online Layer                                                      |
|-----------------------------------|-------------------------------------------------------------------|
| AI models and NVIDIA GPU hardware | Web-based interface for configuration, monitoring, and management |
| No internet dependency at runtime | Internet required for configuration and management                |
| Air-gapped and isolated           | Secure and controlled access                                      |

## A Building-Block Platform of N Customizations

EchoMind Enterprise is a building-block platform that allows organizations to customize and assemble the modules and layers to solve their specific problems. This modular design enables Ajace AI to perform N customizations, tailoring the platform to meet the unique needs of each customer.

- The platform's modularity enables customers to:
- select the specific AI capabilities they need

- configure the platform to meet their unique requirements
- integrate with existing systems and infrastructure

Customization Options

| Customization Type       | Description                                                                        |
|--------------------------|------------------------------------------------------------------------------------|
| Model Selection          | Customers can choose from a range of AI models to suit their needs                 |
| Configuration Options    | The platform offers a range of configuration options to meet specific requirements |
| Integration Capabilities | EchoMind can be integrated with existing systems and infrastructure                |

## We Do Not Sell Hardware We Solve Your Problem

Ajace AI does not sell hardware, but rather provides a private, on-premises AI platform that solves the problem of cloud AI assistants quietly sending prompts, files, and recordings to an outside vendor. Our solution is designed to meet the needs of organizations that require complete control over their data and cannot send it to the cloud.

By not selling hardware, we focus on providing a comprehensive solution that addresses the specific needs of each organization. Our experts will work with you to determine the right hardware and

infrastructure required to ensure that your private AI platform runs smoothly and efficiently.

- Our solution is not a hardware sale, but rather a tailored approach to meet your specific needs.
- We recommend the right hardware and infrastructure to ensure seamless integration and optimal performance.

## Built on Local AI

EchoMind Enterprise's local AI architecture is designed to provide secure and efficient AI processing within the customer's premises. At the core of this architecture lies Llama-3.1-8B, a large language model that enables the platform to generate human-like text, respond to voice commands, and provide live meeting intelligence.

- The platform utilizes TensorRT-LLM for efficient and high-performance AI inference, ensuring fast processing of complex AI tasks.

Furthermore, EchoMind's AI engine leverages nomic-embed-text for advanced text embedding capabilities, enabling the platform to understand and process vast amounts of text data with unparalleled accuracy and speed.

Key Components of EchoMind's Local AI Architecture

| Component        | Description                                                  |
|------------------|--------------------------------------------------------------|
| Llama-3.1-8B     | Large language model for text generation and response.       |
| TensorRT-LLM     | Efficient AI inference engine for fast processing.           |
| nomic-embed-text | Advanced text embedding capabilities for text understanding. |

## Who It Is For

EchoMind Enterprise is designed for organizations that require a high level of security and control over their data. This includes defense, government, legal, finance, and healthcare teams that handle sensitive information and cannot risk sending it to the cloud.

- defense teams that require secure AI-powered threat analysis and intelligence gathering
- government agencies that need to process sensitive data without internet dependency
- legal firms that handle confidential client information and require AI-powered document review and analysis
- finance institutions that need to analyze and generate reports on sensitive financial data without internet access
- healthcare organizations that require secure AI-powered medical research and analysis

## Target Industries and Requirements

| Industry   | Requirements                                                                         |
|------------|--------------------------------------------------------------------------------------|
| Defense    | Secure AI-powered threat analysis and intelligence gathering                         |
| Government | Processing sensitive data without internet dependency                                |
| Legal      | AI-powered document review and analysis                                              |
| Finance    | Analyzing and generating reports on sensitive financial data without internet access |
| Healthcare | Secure AI-powered medical research and analysis                                      |

## Get Started With Ajace AI

To get started with Ajace AI, the first step is to define the scope and requirements of your EchoMind project. This involves identifying the specific use cases and functionalities you need to implement, such as chat, live meeting intelligence, voice, and document generation.

- Define the scope and requirements of your EchoMind project
- Identify the specific use cases and functionalities you need to implement
- Determine the infrastructure and hardware requirements for your project
- Work with Ajace AI to design and shape EchoMind to meet your security posture and compliance needs

Once you have a clear understanding of your project's requirements, you can work with Ajace AI to design and shape EchoMind to meet your specific needs. This includes advising on the infrastructure and hardware requirements that fit your security posture and compliance needs.

## APPENDIX

EchoMind Enterprise is designed to meet the stringent security requirements of organizations that cannot send their data to the cloud. To ensure maximum flexibility and control, the platform can be configured to meet specific system requirements.

- The platform requires a dedicated NVIDIA GPU with a minimum of 8GB of VRAM.
- The system requirements for EchoMind Enterprise are as follows:
- Operating System: Windows 10 or Linux (Ubuntu 18.04 or later)
- NVIDIA GPU: Quadro or Tesla with a minimum of 8GB of VRAM
- CPU: Intel Core i7 or AMD Ryzen 7 (3.5GHz or higher)

For organizations that require a high level of security, EchoMind Enterprise can be configured to run in a completely air-gapped environment. This means that the platform can be set up to operate

without any internet connection, ensuring that data remains completely secure and confidential.

System Requirements for EchoMind Enterprise

| System Requirement | Description                                     |
|--------------------|-------------------------------------------------|
| Operating System   | Windows 10 or Linux (Ubuntu 18.04 or later)     |
| NVIDIA GPU         | Quadro or Tesla with a minimum of 8GB of VRAM   |
| CPU                | Intel Core i7 or AMD Ryzen 7 (3.5GHz or higher) |
